CROMOSINTAGMA

An interesting correspondence between Prof. Roberto De Rubertis, Director of the scientific magazine "XY", and the Author is the introduction to the article.

Following to a first part informing of the most accredited interpretation of the eye-to-brain visual way, one shows Author's theory about the interpretation of the visual system functioning in choosing color combinations (cromosintagma) in the light of the behavior of any important cerebral primary visual cortex cells.

This theory allows to scientifically verify the validity of any color combination and makes possible figuring out and producing the tint or the tints for the best color matching when any tint is given.
